

SUMMARY

Radiofrequency treatment is a 'non-ablative' treatment which means that it acts on the middle and lower layers of the skin while causing little or no damage to the top layer of the skin.

This Radiofrequency heating process is aimed at tightening existing collagen which is the main structural support of the deeper layers of skin (hence immediate results) as well as stimulating new collagen to form

CONTRAINDICATIONS

Radio Frequency cannot be applied to patients with pacemakers, metal plates or pins in the treatment area, severe heart disease, diseases of connective and muscular tissue or pregnant and breast feeding women.

A full consultation form must be filled out before treatment can commence.

RADIO FREQUENCY SKIN TIGHTENING
INFORMATION LEAFLET

INTRODUCTION

The use of radiofrequency in medical practice is not new, it has been used medically for many years.

Radiofrequency is now an effective treatment for long term non-surgical facial skin tightening.

It rests on the principle of the modification of deeper skin layers through heat, which is delivered across the skin without damaging the surface.

Radiofrequency has the ability to heat up deeper layers of the skin. Each time the device touches the skin, it delivers a safe and controlled amount of Radiofrequency energy.

This heats a large area of collagen in the deeper layers of the skin and underlying tissue. The heating action causes deep collagen structures in the skin to immediately tighten, improving existing collagen.

Over time, new collagen is stimulated by the body to further tighten the skin, resulting in healthier, smoother skin and a more youthful appearance.

It requires no time off and makeup can be applied straight after the treatment. Also, radio frequency can be combined with numerous other skin rejuvenation and aesthetic treatments.

WHAT AREAS CAN BE TREATED ?

Improving the jowl area, eyes and neck areas are the most popular and effective uses of radiofrequency.

FOREHEAD - lifts brows, tightens the forehead skin.

UNDER-EYES – thickens and strengthens the delicate skin whilst softening fine lines.

CHEEKS - gives a slight lift and diminishes large open pores. Tightens the upper cheek skin.

MID FACE/JAW LINE – Tightens sagging skin diminishes jowls, so as to firm the jaw-line.

MOUTH AREA – plumps and firms the skin and softens fine lines. Neck – tightens the skin whilst smoothing out lines.

BODY - all areas of the body can be treated. Benefits to all areas are the reduction of cellulite, smoothing out dimpled skin, tighten and toning of the skin. Thighs, buttocks, arms and stomach are greatly improved

WHEN WILL I SEE RESULTS ?

Immediate improvements can be seen. For most clients, further results will be gradual and subtle. Nevertheless, although modest, the changes can make the difference between, for example, a “tired eye” appearance and a rested one. Improvements will become increasingly visible over a six month period and may last for up to two years.

HOW LONG DOES THE TREATMENT TAKE ?

The operator will use a hand-piece containing the electrodes to deliver radio frequency energy which heats the middle and lower layers of the skin

Depending on the size of the area being treated and your response, the procedure usually takes between 30 – 90 minutes in addition to the consultation.

IS THE TREATMENT PAINFUL ?

The treatment feels fairly warm but pleasant and rarely uncomfortable.

POST TREATMENT REGIME

Be gentle with your skin, treat it as though you have just received mild sunburn. You can bathe and shower as usual but do not scrub or exfoliate the skin. You can continue your moisturising routine and apply make up as normal. After treatment apply a 15 SPF. Use an SPF of 30 or higher if you are due to expose your skin to the sun.

It is recommended the client follows the instructions on the aftercare procedure leaflet in order to gain optimum results from this treatment.

Apply serums and solutions as advised by your therapist.

Do not exceed the amount advised.
